

6 KEYS TO KEEPING BIOLOGICALS ALIVE AND EFFECTIVE ON-FARM

USE LOW-SALT STARTERS

With a salt index of 4, Upshift® C Pro unlocks nutrients and is a direct replacement for traditional starters that are high salt and kill biologicals.

REPLACE TRADITIONAL LIQUID SEED TREATMENT

Deliver biologicals as a dry seed treatment through Bio-Capsule Technology™ to preserve microbial viability from application to planting. Unlike traditional liquid seed treatments that rely on polymers and liquid carriers, it applies living microbes directly to the seed for more beneficial biology where it's needed most.

ADOPT TECHNOLOGY THAT KEEPS BIOLOGICALS ALIVE

Adopt Bio-Capsule Technology™ for seed fluency and/or liquid ready applications to get the best results from biologicals. Bio-Capsule is the most convenient way to deliver live biologicals on the farm by keeping biologicals separate until the point of application.

ADOPT BIOLOGICAL-FRIENDLY NITROGEN MANAGEMENT PRODUCTS

Market-leading below-ground nitrogen stabilizers use active ingredients (nitropyrin, DCD) labeled as bacterialsides. Replace these bio-adverse products with nitrogen stabilizers containing calcium nitrates and select polymers.

FUEL BIOLOGICAL PERFORMANCE

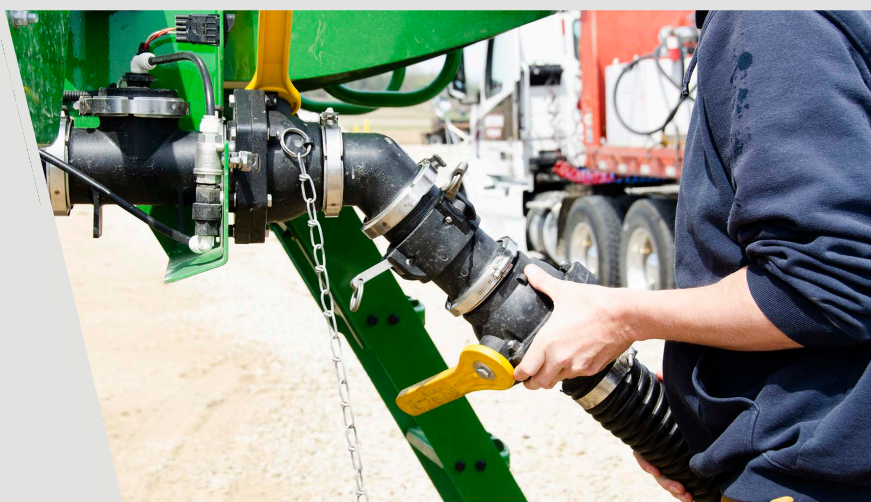

Biologicals perform best when the plant has the energy and nutrition to respond. HarvestShield® Evo and Homestretch® NKB-S Evo optimize nutrient utilization, support photosynthesis and help crops overcome abiotic stress so both the plant and the biology can work together to maximize yield potential.

REMOVE CHLORINE FROM SPRAYER APPLICATIONS

Farm operations that use water sources containing chlorine risk killing biologicals in liquid applications. BioFlex takes chlorine out of water to ensure you get the best performance out of biologicals.
